

Enterprise OS

Enterprise OS

It's Not the AI You're Missing. Own Your Intelligence.

Why Your Enterprise AI Is Failing · Dave Tanaka / 田中訓 · February 2026

The Problem No One Talks About

“I once asked an internal assistant to summarize a document I had permission to access. It declined due to policy restrictions. When AI appears 'blocked,' the issue is often not the model — it's the way meaning is governed and structured.”

The AI wasn't broken. It was underfed — missing the structure of meaning, the ontology, it needed.

88%

of organizations now use AI in at least one function (McKinsey 2025)

39%

Only a small share say AI is fully scaled enterprise-wide (McKinsey 2025)

1.8 hrs

Employees still spend much of the day searching for information (MGI)

The Root Cause

It's not the AI. Meaning — entities and their relationships — is fragmented across systems, and no one owns the company's ontology.

ERP / SAP

CRM / Salesforce

SharePoint

Email Servers

Internal Wiki

Product DBs

Legacy Systems

Personal PCs

Shared Drives

Translation Mgmt

Web CMS

HR Systems

Many disconnected systems · No shared map of meaning (ontology) · Fragmented search · AI can't connect meaning across them

What Post-it® Notes Teach Us About AI-Ready Organizations

1968

①

Spencer Silver invents a 'failed' adhesive. It sticks but peels off. Nobody sees a use for it.

12 Years Later

②

Art Fry needs a bookmark for his hymnal. He remembers Silver's 'failure.'

Post-it® Notes

③

Born from 15% Culture — the policy letting employees spend 15% of their time exploring.

What if every organization were designed so people naturally had space to explore — not as a policy, but as part of how the system works?

The Idea of an Enterprise OS

Own your company's intelligence as an Entity Graph — and cultivate and govern it over time.

① Entity Graph

①

The meaning you own. What things mean and how they connect, held as a graph of entities and relationships. This is what finally makes enterprise AI work.

② Cultivate & Govern

②

GitHub as the box. commit = how meaning changes, branch = variants, pull request = reviewed changes, fork = extend to partners. The box is replaceable; the graph is the point.

③ Human Flourishing

③

When AI handles the routine, time comes back — not for more work, but for human work: connecting with customers, partners, colleagues, and family.

A Practical Foundation: Git as the Box that Cultivates Meaning

Software engineering has solved this for decades. The opportunity now is to apply it company-wide.

What is Git?

Like 'Track Changes' — applied to all corporate knowledge.

- Every change recorded: who, when, why
 - Nothing is ever lost — full rollback
 - Teams work in parallel, no conflicts
 - Review & approval before going live

The Proposal

Use Git as the box to cultivate and govern the meaning you own — not just code.

- Cultivate & govern the meaning you own
 - AI reads from Git — context, history, traceability
 - Existing approval workflows integrate
 - Decades of innovation, searchable

90%+ of Fortune 100 use it · 150M+ developers · manufacturing to finance to healthcare — GitHub (2025); Forrester TEI (Jul 2025)

How It Works

Your owned Entity Graph at the center — GitHub is the box that cultivates and governs it, connecting data, AI, and outputs.

Three Questions You're Probably Asking

How do systems connect?

①

GitHub Actions syncs via REST APIs. Mature connectors exist for ERP, CRM, SharePoint — no custom middleware. PoC 3mo → connectors 6mo → rollout 12–18mo.

What about security?

②

Enterprise Cloud with data residency · RBAC · Advanced Security (GHAS) secret scanning · SOC2 Type II / ISO 27001 / FedRAMP.

What do users see?

③

Most never see GitHub — work just runs better. Marketing uploads as usual; engineers work in GitHub; leadership just asks the AI.

The Cost of Standing Still

What It Costs Today

1.8 hrs/day searching (McKinsey)
35% of work lost to search & rework
(Bloomfire/HBR)
30% slower cross-team work from silos
\$31.5B/yr lost by Fortune 500 (IDC)

What Enterprise OS Unlocks

3.9 hrs/wk recovered per employee
(Bloomfire)
20–25% productivity gain (McKinsey)
376% ROI over 3 years (Forrester TEI)
35% less time searching (McKinsey)

Most Fortune 500 already pay for GitHub Enterprise. The real cost is integration & configuration — not licensing.

In Practice: Before & After

Customer Support

TODAY

Agent searches 5 systems manually → ~47 min to find a case
→ answers vary by region

WITH ENTERPRISE OS

Agent asks the AI → finds the case + similar ones in seconds
→ consistent answers worldwide

Marketing Campaign

TODAY

Teams start from scratch → past campaigns hard to find →
weeks of work per region

WITH ENTERPRISE OS

AI finds 12 similar past campaigns → draft in hours → auto-
adapts to local markets

Every Employee Can Build

GitHub + AI doesn't just support engineers — it lets everyone build.

Before: Engineers Build, Others Request

Marketing needs a page → ticket → waits 3 weeks

Sales needs a report → asks IT → next quarter

Regional team → email chain → lost in translation

After: Everyone Builds, AI Assists

Describe need → AI generates → PR review → live

Ask AI → answer with sources → act now

Fork → AI translates & adapts → done

“The most valuable builders in 2026 will be those who can describe what they need — not just those who can code it.”

Efficiency Isn't the Destination

OpenAI's 2025 Enterprise AI Report: employees save 40–60 min/day. But where does that time go?

Human ↔ Human

Colleagues

Customers

Partners

Family

The companies that win the AI era won't have the best AI — they'll use AI to become more human.

The Virtuous Cycle

When people thrive, companies grow. Enterprise OS is the catalyst.

Employee Self-Realization

Purpose & growth — 15% time for learning
Mental health — less burnout, more meaning
Human connection — time to mentor & listen
Work-life integration — presence at home

Company Growth

Retention — engaged people stay;
knowledge compounds
Talent — 'they invest in my growth' recruits
Innovation — ideas recorded, shared, built
upon
Loyalty — customers feel heard

Getting Started

You don't have to boil the ocean. Start with one workflow.

01 · Pick One Pain Point

①

Find the workflow where knowledge fragmentation hurts most — localization, support, compliance.

02 · Build a PoC on GitHub

②

Move the docs in. Version control, branches for variants, PR-based approval. Show it works.

03 · Add the AI Layer

③

Connect an AI assistant to read the repo. Now it has context, history, structure — genuinely useful.

04 · Expand Organically

④

Success drives adoption. Each connected workflow makes the platform smarter.

Why Now?

“This loop becomes the new IP of the firm.”

— Satya Nadella, CEO of Microsoft (June 2026)

He draws the line at owning the loop — the process. We draw it one level deeper: own the thing the loop runs on — your meaning, your ontology.

① The AI Gap Is Widening

88% use AI; only 39% see impact (McKinsey, Nov 2025). The difference is the foundation of meaning you own.

② Knowledge Is Walking Out

Boomers retire 10,000+/day in the U.S. Every undocumented departure is permanent loss.

③ The Technology Is Ready

Git, GitHub Enterprise, AI APIs all exist. The missing piece is the vision to connect them.

About the Author

Dave Tanaka / 田中訓 — Digital Marketing & AI Practitioner · 30+ years

30+ Years at Marketing × Tech

1991–97 ASCII — MacPower, Editor & first Webmaster

1997–00 Adobe — adobe.com/jp 15K→9M PVs (600×)

2000–03 Apple — apple.com Japan launches

2003–11 Adobe — eCommerce 4%→16% of sales

2011–Now Global manufacturing — AI tools & automation

commit log

Career across media, creative tools, consumer tech, manufacturing

Built AI enterprise tools (translation, knowledge search) — practice, not theory

Country Leader for AI & digital marketing
